CSE344: Hw3

I certify that every answer in this assignment is the result of my own work; that I have neither copied off the Internet nor from any one else's work; and I have not shared my answers or attempts at answers with anyone else.

1. Analysis of the time complexity of a recursive algorithm has resulted in the following recurrence equations.

$$\begin{aligned}T(1) &= 1 \\T(n) &= n^2 + 4T\left(\frac{n}{2}\right) \text{ for } n > 1\end{aligned}$$

- (a) Use the top-down method to find a closed-form solution for $T(n)$. (Recap: the top-down method is one in which you use the recurrence equations to rewrite $T(n)$ in terms of $T(x)$ where $x < n$ and repeat the process until you reach the base case.)
- (b) Draw a recursion tree to get a closed-form solution for $T(n)$. Use the notation in the class (show the input size within each node, annotate it with the non-recursive time, indicate the number of nodes at each level, the non-recursive time for each level near the right margin, and the grand total vertically below). Your tree must include at least three topmost levels including the root and two bottom-most levels including the leaf.

(a) $T(1) = 1$
 $T(n) = n^2 + 4T(n/2)$ for $n > 1$

$$T(n) = n^2 + 4(n/2)^2 + 16T(n/4) \quad \text{After 1 substitution}$$

$$T(n) = n^2 + 4(n/2)^2 + 16(n/4)^2 + 64T(n/8) \quad \text{After 2 substitutions}$$

$$T(n) = n^2 + 4(n/2)^2 + \dots + 4^{n-2}(n/2^{n-2})^2 + 4^{n-1}T(n/2^{n-1}) \quad \text{After } n-2 \text{ substitutions}$$

$$T(n) = n^2 + 4(n/2)^2 + \dots + 4^{n-2}(n/2^{n-2})^2 + 4^{n-1}(n/2^{n-1})^2 + 4^n(n/2^n)^2 \quad \text{After } n \text{ substitutions}$$

$$T(n) = n^2 + 4(n/2)^2 + \dots + 4^{n-2}(n/2^{n-2})^2 + 4^{n-1}(n/2^{n-1})^2 + 4^n n^2 / 4^n \quad \text{After } n \text{ substitutions}$$

$$T(n) = n^2 + n^2 + \dots + n^2 \quad \text{After } n \text{ substitutions}$$

$$T(n) = O(n^2 \log(n))$$

(b)

$$T(1) = 1$$

0

$$T(n) = n^2 + 4T\left(\frac{n}{2}\right) \text{ for } n > 1$$

Recursive call

$$T(n) \quad i=0$$

$$T\left(\frac{n}{2}\right) \quad i=1$$

$$T\left(\frac{n}{2^2}\right) \quad i=2$$

$$T\left(\frac{n}{2^3}\right) \quad i=3$$

3

$$\frac{n^2}{2^i}$$

—

i

$$1 = \frac{n}{2^i}$$

$$\log_2 n = i$$

$$\sum_{i=0}^{\log_2 n} \frac{n^2}{2^i} = n^2 \sum_{i=0}^{\log_2 n} \frac{1}{2^i}$$

$$= n^2 \cdot \left(1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots + \frac{1}{2^{\log_2 n}}\right)$$

$$\sim \Theta(n^2 \log n)$$

2. Suppose $T(n)$ satisfies the following recurrence equations.

$$T(1) = 1$$

$$T(n) = n + 4T\left(\frac{n}{4}\right) \text{ for } n > 1$$

Use the substitution method (based on the Principle of Induction) to verify that $T(n) = \Omega(n \lg n)$.

Guess: $T(n) = \Omega(n \lg n)$ ----> i.e $T(n) \geq c(n)(\lg n)$ for all n .

Prove By Induction that:

$T(n) \geq c(n)(\lg n)$ for all $n \geq n_0 \geq 1$ and some $c \geq 0$

Assume $T(m) \geq (c)(m)(\lg m)$ for all $2 \leq m < n$.

Proof:

$$\begin{aligned} T(n) &= 4T(n/4) + n \\ &\geq 4(c \cdot n/4 \cdot \lg(n/4)) + n \\ &= cn \cdot \lg(n/4) + n \\ &= cn(\lg n) - cn + n \\ &\geq cn(\lg n) \text{ if } -cn + n \leq 0 \Rightarrow c \leq 1 \end{aligned}$$

True if $c \leq 1$

So, by choosing $c = 1$, we can establish our guess that $T(n) = \Omega(n \lg n)$
